Data collection	This study is using available data from the “palmerpenguins” package in R, that contains the information of different penguin populations that were surveyed. Some data has been collected but not by me.
------------------------	---

Hypothesis

There is an association between the penguin species abundance and the island surveyed.

Dependent variable

The penguin species abundance (and my grades)

Conditions

The island where data was collected (and how well this is written)

Analyses

A chi squared contingency test will be done between the islands and spp. to test for variations in the number of penguins that belong to a species.

**Outliers and
exclusions**

eeeeh, yes?

Sample size

The information has already been collected. There are just 344 observations

Other

Not in reality. Again, this is an excersice.

Study type

Finally. For record keeping purposes, please tell us the type of study you are pre-registering.

- Class project or assignment
